Terrestrial Space Radiation and Its Biological Effects Nov 28 2019 This volume is based on the proceedings of an Advanced Study Institute (ASI) sponsored by the North Atlantic Treaty Organization (NATO) held October 1987 in Corfu, Greece. The Institute received financial support from the National Aeronautics and

Deutsche Forschungs-und Versuchsanstalt fur Luft und Raumfahrt e.v., Kaln, Germany The advent of the shuttle era is providing fresh impetus for large space ventures such as communication centers, solar power stations, astronomical

Such ventures will rely heavily on an extensive and prolonged human presence in space doing in-orbit construction, maintenance, and operation. solar energy and astronomical signals unattenuated by the atmosphere. Central to long-term manned space missions are the problems associated with the effects of exposure to ionizing radiations on humans. Manned space missions in the past have encountered relatively benign radiation environments because of their very short duration and orbit configuration. However, crew stay time of up to a year has been recently achieved by the Soviet space program; and Mars missions lasting several years are under serious consideration.

Progress in Nucleic Acid Research and Molecular

Biology Jan 11 2021 Nucleic acids are the fundamental building blocks of DNA and RNA and are found in virtually every living cell. Molecular biology is a branch of science that studies the physicochemical properties of molecules in a cell, including

nucleic acids, proteins, and enzymes. Increased understanding of nucleic acids and their role in molecular biology will further many of the biological sciences including genetics, biochemistry, and cell biology. Progress in Nucleic Acid Research and Molecular Biology is intended to bring to light the most recent advances in these overlapping disciplines with a timely compilation of reviews comprising each volume.

Vascular Dysfunction Beyond Pathological Pregnancies. An

International Effort Addressed to Fill the Gaps in Latin

America Nov 08 2020

Pregnancy is a physiologically stressful condition that generates a series of functional adaptations in the cardiovascular system. The impact of pregnancy on this system persists from conception beyond birth.

Recent evidence suggests that vascular changes associated with pregnancy complications, such as preeclampsia; gestational diabetes; growth restriction; autoimmune diseases; among others, affect the function of the maternal and offspring vascular systems, after delivery and may be extended until adult life. Since

the vascular system contributes to systemic homeostasis, defective development or function of blood vessels predisposes both mother and infant to future risk for chronic disease. In Latin American countries, like other low (LIC) and middle-income countries (MIC) worldwide, the rate of morbi-mortality due to both pregnancy complications and cardiovascular diseases have a higher incidence than in high-income countries (HIC). But, investigation in LIC and MIC, in particular in Latin America, still fall short of what would be expected considering the magnitude of those diseases. Although there are obvious deficiencies in terms of

economies and scientific infrastructure between HIC and MIC or LIC, Latin American strength in terms of scientific productivity in this field could be underestimated due to language limitation and publication in journals not indexed in major citation databases, resulting in low impact publications. As a result, we could speculate that potentially unique features of vascular disease associated to pregnancies complications can be unnoted in the global scientific community. Then, we would like to encourage researchers in vascular biology, in which, many groups in Latin America have contributed to both better

understand vascular dysfunction associated to pregnancy diseases and show the gaps in the literature, to overcome this hidden effect of our scientific production. This effort also will homogenize clinical concepts and knowledge that may strengthen the scientific effort in Latin America.

Radiotherapy, Surgery, and Immunotherapy Jun 03 2020

The history of the development of cancer therapy has been marked by a recurring pattern, one of initially exciting and encouraging results as new methods were introduced, followed by dismaying failures.

The extremity of the disease and its high mortality have dictated that each means of damaging tumor cells would be rapidly explored and exploited as a mode of therapy, long before the corresponding theory and technique were completely understood and perfected. Thus radiation was used as an antitumor agent almost immediately following recognition of its cytotoxic capability. Equally constant, following the rapid utilization of new therapeutic methods, has been a period of significant technical improvements. This second aspect of the pattern is also illustrated by the field of radiotherapy. New radiation

sources, new methods of dosimetry, use of high-energy radiation, and other new techniques allowed the therapist to better focus upon the tumor and to improve the geometry of exposure. Thus, with each technical advance, the "reach" of radiotherapy was increased and damage to normal tissues was decreased. Inevitably, however, a limit was reached, a point at which clinicians and researchers realized they could go no further without returning to a more fundamental search, one based on the biology of the tumor cell itself.

The Eye Pt IB Jul 05 2020 The Eye, 3rd Edition, Volume 1b: Vegetative Physiology and

Biochemistry deals with the vegetative physiology and biochemistry of the eye. The book reviews major advances in the anatomy of the eye and its physiological and biochemical aspects, particularly the cornea and sclera, the ordered state of the lens, and lens development, growth and regeneration. This edition is organized into three chapters and begins with an overview of the mechanical and optical properties of the cornea and sclera and their relationship to the underlying structure of the tissue. This book shows that, in the cornea, the maintenance of the tissue structure requires the constant action of a fluid transport

system dependent upon metabolic energy. The pathways of corneal nutrition, the sensitive corneal innervation, and the growth processes in the cornea and sclera are also discussed, emphasizing the mammalian cornea. The next chapter examines the use of physical and chemical techniques to determine how the ordered state of the lens is maintained and why that state is susceptible to chaotropic attack. Finally, an account of the metabolism of the lens and how cataract forms is given. This book is a valuable resource for students and researchers in fields ranging from ocular science to

Biological Effects and Physics of Solar and Galactic Cosmic Radiation

Oct 08 2020 Space missions subject human beings or any other target of a spacecraft to a radiation environment of an intensity and composition not available on earth. Whereas for missions in low earth orbit (LEO), such as those using the Space Shuttle or Space Station scenario, radiation exposure

guidelines have been developed and have been adopted by spacefaring agencies, for exploratory class missions that will take the space travellers outside the protective confines of the geomagnetic field sufficient guidelines for radiation protection are still outstanding. For a piloted Mars mission, the whole concept of radiation protection needs to be reconsidered. Since there is an increasing interest in many nations and space agencies in establishing a lunar base and for exploring Mars by manned missions, it is both, timely and important to develop appropriate risk estimates and radiation protection guidelines which will have an influence on

This book is the result of a multidisciplinary effort to assess the state of art in our knowledge on the radiation situation during deep space missions and on the impact of this complex radiation environment on the space traveller. It comprises the lectures by the faculty members as well as short contributions by the students given at the NATO Advanced Study Institute "Biological Effects and Physics of Solar and Galactic Cosmic Radiation" held in Armacao de Pera, Portugal, 12-23 October, 1991. *X-Ray Equipment Maintenance*

Photophysiology Jun 27 2022

Photophysiology: Current

Topics in Photobiology and Photochemistry, Volume VI is a collection of papers that discusses photobiological phenomena found on cells of organisms. The papers in this collection deal with specialized areas of photobiology. One paper describes the instruments used in measuring the course of chlorophyll fluorescence in vivo that occurs when a chlorophyll molecule, stimulated by a light source, returns to its ground state from a previous first singlet state, resulting in a light emission lasting for a few nanoseconds. Another paper discusses the mechanism of light-induced carotenoid synthesis in nonphotosynthetic plants,

including temperature-independent photochemical reactions, which results in the organism's producing carotenoids on subsequent incubations in darkness. One paper also explains photosensitization observed in mutant cells resulting from exposure to specific wavelength of light in the presence of a natural sensitizer. This paper points out that there are four main groups of photosensitizers, namely, the hypericins, chlorophylls, porphyrins, and psoralens. This book can prove valuable for cell biologists, micro-biologists, students, and researchers involved in the fields of photobiology and

Surgery Apr 25 2022 Surgery: A Case Based Clinical Review has proven to be the premiere resource to help prepare medical students for the surgical shelf exam and clinical wards. The second edition was conceived after listening to the feedback we received from students. We have added several new chapters and updated the others. This book continues to provide the reader with a comprehensive

understanding of surgical diseases in one easy-to-use reference that combines multiple teaching formats. The book begins using a case based approach. The cases presented cover the diseases most commonly encountered on a surgical rotation. The cases are followed by a series of short questions and answers, designed to provide further understanding of the important aspects of the history, physical examination, differential diagnosis, diagnostic work-up

and management, and questions that may arise on surgical rounds and on the shelf exam. The book is written in an easy-to-understand manner to help reinforce important surgical exam concepts. The second edition of Surgery: A Case Based Clinical Review will be of great utility for medical students when they rotate on surgery, as well as interns, physician assistant students, nursing students, and nurse practitioner students.
